

DECANTER CENTRIFUGES & PLANTS FOR SOLID/LIQUID SEPARATION

RELIABLE REMOTE MONITORING of decanter centrifuges

HILLER REMOTE MONITORING

Operators of decanter centrifuges, whether they are manufacturing companies, operators or the processing industry, need to respond ever more quickly to changing requirements from the outside. Faults resulting in a machine standstill cause aggravation and incur costs.

These downtimes can be significantly reduced and often even avoided entirely with the flexible remote maintenance solution from HILLER, for example via a web-based service portal and the corresponding intelligent terminals. HILLER remote monitoring is designed as a universal and complete solution for the simple and reliable connection of networks via the internet.

BENEFITS

- Rapid support in the event of faults
- Continuous process optimisation
- Low technical requirements
- Simple and reliable connection
- Simple administration
- Detailed reporting

RAPID SUPPORT

HILLER remote monitoring is suitable for everything from operating a small sewage treatment plant to integrating a large number of industrial decanters, that require technical support worldwide. All that is required is access to the internet, either via the company's network, via a home DSL connection or on the move via a UMTS modem.

If necessary, a HILLER service engineer can access the machines and systems at the click of a mouse within minutes.

HILLER remote monitoring is also available with optional recording. The data from these operations are stored on HILLER's server.

SAFETY for your DATA

HILLER remote monitoring naturally fulfils the high safety requirements that apply to access a corporate network, but without significant technical requirements.
